Hello,

You are receiving this since you are shortlisted for the projects that I floated. Since both the projects require to develop software interface for grading/peer-grading, I need to see your interest in developing a grading system. Here is a small prototype for you to design and give a demo by **Jan 3, 2024**. You can work independently or in a group and show the demo accordingly.

The prototype system should have 10 students, 2 instructors who are going to grade these papers. The view of the students will be different from the instructors. See this playlist to understand how it looks like for gradescope. Your task is to make a simplified backend and frontend design for such a system. (This is a task irrespective of whether you work on Core02 or Core03 project below) At this point, it is not necessary that all functions of the tool to work perfectly, but you should be able to demonstrate that you are capable of designing the basic skeleton of a grading platform, i.e., the papers display properly on the grader interface, graders can create rubrics and apply them, the graded papers are visible to the students. Feel free to use any language or libraries for making this. Using Django could be beneficial here.

11paperstogether.pdf (~5.2 MB) quiz1_template.pdf (~164 KB)

attached are the two files discussed. i have added Manav and Harsh in the CS 6001 fall 2022 gradescope as TA so that you can check out the features yourself. Don't change any of the existing assignments. If you want you can create a new assignment to see how the tool behaves in each step.

don't use the files for any purpose apart from this project.
